CyberLock Access Solutions for Healthcare Facilities

Corvallis, Oregon, December 2, 2011—CyberLock® offers versatile, cost-effective access control solutions for hospitals, healthcare facilities, and pharmacies that are challenged with ensuring HIPAA/HITECH and JCAHO compliance. The CyberLock System of electronic lock cylinders and programmable keys provides the flexibility and customization a facility needs to manage and audit traffic to areas that contain confidential records, financial data, narcotics, and expensive lab equipment.

CyberLock saves thousands of dollars at the door because it uses a facility's existing mechanical lock hardware and no wiring is required for installation. Within minutes, a mechanical lock can be retrofitted with a CyberLock electronic cylinder. The electronic cylinders can be installed nearly anywhere controlled access and auditing is needed, including server cabinets, drug dispensaries, computer carts, supply rooms, pharmacy cabinets, and more.

CyberLock eliminates incidents of unauthorized entry. Each authorized employee's key can be programmed with the specific access permissions they need to do their job: what locks they may open, and when they may open them. Both the electronic key and lock record key activity and lock openings. The system's email alerts and audit reporting keep management informed of each person's activities so they can stay out in front of potential security issues.

With CyberLock, a healthcare facility no longer faces the inconvenience and expense of re-keying. A key's access rights can be changed electronically without mechanical re-keying and a missing key can be quickly deactivated from opening any locks. To further minimize risk, the key can be set with a time to begin operation and a time to expire by the hour, day, week, and month.
